

The DRT project will apply the following principles during decision-making:

- **Customer-centered design for technology reviews.**  
Focus on solutions that meet customer and agency needs, creating value through user experience and mission outcomes.
- **Adopt a customer and agency mindset over individual team or process focus.**  
Prioritize collective outcomes and enterprise success over isolated objectives.
- **Collect only the critical information needed to make integrated and competent decisions.**  
Streamline inputs to emphasize quality, relevance, and clarity in every review.
- **Unify technology design processes while reducing complexity.**  
Create consistency across reviews, simplify interactions, and promote efficient collaboration.
- **Data informs how we design, prioritize, and evolve technology review decisions.**  
Use integrated, evidence-based insights to evaluate impact, guide priorities, and continuously improve the process in alignment with our vision.
- **Reuse existing enterprise data sources to enhance customer experience.**  
Build upon trusted data to drive insight, avoid redundancy, and strengthen integration across systems.
- **Ensure reviews are proportional to defined tiers of risk and impact.**  
Match review depth and rigor to the potential effect on enterprise systems, users, and outcomes.
- **Accept appropriate levels of risk as necessary to achieve the vision.**  
Embrace responsible innovation by balancing risk with opportunity and value.
- **Ensure accountability among all participants for their roles and responsibilities.**  
Promote transparency, shared ownership, and trust across every phase of the review process.
- **Align and Evolve Policy and Regulatory Frameworks to Support Vision.** We ensure compliance with existing policies and regulations while proactively identifying and addressing changes needed to achieve the vision.
