Washington Enterprise Shared Tenant Service

The Washington Enterprise Shared Tenant (the Tenant) changes how organizations have historically managed their IT infrastructure, by shifting the management of these resources to cloud providers. With the ability to serve multiple tenants from Microsoft 365 via a common, cloud-based server, Washington state agencies can benefit from shared resources (such as existing data centers, computers, operating systems, software applications and maintenance).

A tenant is the organization that owns and manages a specific instance of Microsoft cloud services. The Tenant allows multiple customers to share resources in a single organization. Similar to an apartment complex, each customer Agency resides in their own specific workspace within the Tenant.

Benefits

On-demand access – anywhere, anytime, on any device

The Tenant lives in the Cloud and is accessed through the internet. Configured for multiple operating systems, you can find the latest versions of Microsoft 365 applications on any device from any location.

Enhanced security

Data is secured in five different layers - data, application, host, network and physical. Each tenant’s data is isolated and remains invisible to other tenants.

Increased productivity

Real-time collaboration, synchronized data, single sign-on, and seamless coordination and compatibility with the Office tools you already know.

Improved IT efficiency

By sharing infrastructure resources like servers, heating, cooling, security and more, an agency does not have to provision or manage any infrastructure or software above and beyond internal resources. This enables focus on their mission instead of spending time and effort managing and maintaining a lot of hardware and software.

Release 1
(September 30, 2019)

- Exchange Online
- Exchange Online Archive
- Exchange Online Protection
- OneDrive
- SharePoint
- Skype Online (no PBX integration)
- Microsoft Office Suite
